

Serial No.: 10/533,248
Art Unit: 2618

AMENDMENTS TO THE CLAIMS:

This listing of the claims will replace all prior versions, and listings, of the claims in this application:

Listing of Claims:

1. (Previously Presented) A method of forming a beam of a signal to be transmitted, the method comprising:

providing a codebook (C) of parameters that modify a transmitted signal:

providing a channel matrix (H) of parameters representing the properties of a channel;

transmitting a signal from a base station along the channel using an antenna comprising at least two elements;

receiving said transmitted signal in a mobile station and estimating a parameter in the channel matrix characteristic of the channel by selecting the value of a parameter in the codebook that minimizes a criterion;

transmitting an indication of the selected parameter over the return channel; and

applying the codebook entry associated with the selected parameter to subsequent transmissions from the base station, wherein when $2^{R/r}/t < 1$, where R is a rate of transmission in bits/sec/Hz, r is a number of receive antennas, and t is a number of transmit antennas, a unit rank beamforming scheme is used, otherwise a higher rank beam forming scheme is used.

2.(Original) A method according to claim 1, in which an eigenvector of said channel matrix is provided by a calculation based on said parameter.

3.(Original) A method according to claim 2, in which said calculation is performed in said mobile station.

4.(Original) A method according to claim 1, in which said base station transmits a set of initial setup signals that are used by the mobile station to estimate the parameters of the channel.

Serial No.: 10/533,248
Art Unit: 2618

5.(Original) A method according to claim 4, in which an eigenvector of said channel matrix is provided by a calculation based on said parameter.

6.(Original) A method according to claim 5, in which said calculation is performed in said mobile station.

7.(Previously Presented) A method according to claim 1, in which the signal is divided into frames and the process of estimating a parameter, transmitting an indication of the selected parameter and applying the codebook entry is repeated for each frame.

8.(Original) A method according to claim 7, in which an eigenvector of said channel matrix is provided by a calculation based on said parameter.

9.(Original) A method according to claim 8, in which said calculation is performed in said mobile station.

10.(Original) A method according to claim 1, in which said base station transmits a set of initial setup signals that are used by the mobile station to estimate the parameters of the channel.

11.(Original) A method according to claim 10, in which an eigenvector of said channel matrix is provided by a calculation based on said parameter.

12.(Original) A method according to claim 11, in which said calculation is performed in said mobile station.

13.(Previously Presented) A method of forming a beam of a signal to be transmitted, the method comprising:

providing a codebook (C) of parameters that modify a transmitted signal:

providing a channel matrix (H) of parameters representing the properties of a channel between a base station and a mobile station;

Serial No.: 10/533,248
Art Unit: 2618

transmitting a signal from the base station along two eigenvectors of a channel, the power allocation between said two eigenvectors being quantized independently from the quantization of the eigenvectors, in which $P_1 = kP_2$, where $0 \leq k \leq 1$, P_1 is the power in the dominant eigenvector, P_2 is the power in an other eigen channel, and k is selected from the group 1, $\frac{1}{2}$, $\frac{1}{5}$, and 0.

14.(Original) A method according to claim 13, in which the quantization of the power allocation is performed at the receiver.

15.(Canceled).

16.(Original) A method according to claim 13, in which the dominant eigenvector is quantized by calculating the eigenvector in the relevant codebook that maximizes $\|H(C_i^\dagger)\|_2$.

17.(Previously Presented) A method according to claim 16, in which the second of two eigenvectors is calculated by finding that vector in an orthogonal subspace to the first eigenvector that maximizes the inner product with a beamformer codebook in the orthogonal subspace to the said relevant codebook.

18.(Original) A method according to claim 16, in which the quantization of the power allocation is performed at the receiver.

19.(Canceled).

20.(Previously Presented) A method of constructing a beamformer, the method comprising:
providing a unitary space-time constellation of at least one signal i having a coherence time T and one transmit antenna and applying the constellation as a set of at least one beamforming vectors in an array of T antennas, in which said set of at least one beamforming vectors have the form

Serial No.: 10/533,248
Art Unit: 2618

$V_j = 1/\sqrt{n} \exp(i2\pi j/N)$ where $j = 0, 1, 2, \dots, N-1$, where j represents a particular beamforming vector, i denotes an imaginary number, n equals the number of transmit antennas, and N equals the number of beamforming vectors.

21.(Canceled).

22.(Previously Presented) A method of constructing a beamformer of N vectors, the method comprising:

providing a transmitter system having n transmit antennas;

forming a set of N functions in a unitary space time constellation with one antenna and a coherence time of n ; and

applying said set of N functions as a set of N beamforming vectors, in which said set of at least one beamforming vectors have the form

$V_j = 1/\sqrt{n} \exp(i2\pi j/N)$ where $j = 0, 1, 2, \dots, N-1$, where j represents a particular beamforming vector, i denotes an imaginary number, n equals the number of transmit antennas, and N equals the number of beamforming vectors.

23.(Canceled).

24.(Previously Presented) A method according to claim 20, the method comprising:

providing a codebook (C) of parameters that modify a transmitted signal according to claim 20:

providing a channel matrix (H) of parameters representing the properties of the channel;

transmitting a signal from the base station along a channel using an antenna comprising at least two elements;

receiving said transmitted signal in said mobile station and estimating a parameter in the channel matrix characteristic of the channel by selecting the value of a parameter in the codebook that minimizes a criterion;

transmitting an indication of the selected parameter over the return channel; and

applying the codebook vector associated with the selected parameter to subsequent

Serial No.: 10/533,248
Art Unit: 2618

transmissions from the base station.

25.(Previously Presented) A transceiver comprising:

a receiver for receiving a first signal from a sender over a channel from at least two transmit antennas;

a computer readable storage medium for storing a codebook C of parameter;

circuitry coupled to the codebook and to the receiver for estimating a parameter of a channel matrix of the channel by selecting a value of a parameter in the codebook that minimizes a criterion; and

a transmitter for transmitting to the sender an indication of the selected value of the parameter prior to receiving a second signal from the sender, wherein when $2^{R/r}/t < 1$, where R is a rate of transmission in bits/sec/Hz, r is a number of receive antennas, and t is a number of transmit antennas, a unit rank beamforming scheme is used, otherwise a higher rank beam forming scheme is used.

26.(Previously Presented) The transceiver of claim 25, wherein said circuitry further is for determining an eigenvector of said channel matrix based on the estimated parameter.

27.(Previously Presented) The transceiver of claim 25, wherein said circuitry estimates the parameter of the channel matrix using a set of initial setup signals received with the first signal.

28.(Previously Presented) The transceiver of claim 25, wherein the circuitry is for estimating a parameter of a channel matrix of the channel by selecting a value of a parameter in the codebook that minimizes a criterion for each frame of received signals.

29.(Previously Presented) The transceiver of claim 1 disposed within a mobile station.

30.(Previously Presented) A transceiver comprising:

first circuitry for quantizing at least two eigenvectors for a signal to be transmitted;

second circuitry for quantizing a power allocation among the at least two eigenvectors in

Serial No.: 10/533,248
Art Unit: 2618

a manner that is independent of the quantizing the at least two eigenvectors; and

a transmitter for transmitting the signal along the at least two eigenvectors with the quantized power allocation among the at least two eigenvectors, wherein the power for the dominant eigenvector is P_1 and for a less dominant eigenvector is P_2 , the power allocation being $P_1 = kP_2$; where k is selected from the group 1, 0.5, 0.2, and 0, wherein the first circuitry quantizes a non-dominant eigenvector of the at least two eigenvectors by finding that vector in an orthogonal subspace to the dominant eigenvector that maximizes an inner product with a beamformer codebook in the orthogonal subspace to the said codebook C.

31.(Previously Presented) The transceiver of claim 30, wherein the first circuitry comprises a receiver for receiving a wireless message that includes the quantized power allocation.

32.(Canceled).

33.(Previously Presented) The transceiver of claim 30, wherein the first circuitry quantizes a dominant eigenvector of the at least two eigenvectors by calculating that eigenvector in a codebook C that maximizes $\|H(C_i^1)^\dagger\|_2$ for a channel matrix H.

34.(Canceled).

35.(Previously Presented) A transceiver comprising:

a receiver for receiving at least one signal i in a coherence interval T;

circuitry for applying a unitary space-time constellation of the at least one signal i as a set of at least one beamforming vectors in an array of T antennas, wherein the set of N functions are of the form

$V_j = 1/\sqrt{n} \exp(i2\pi j/N)$ where $j = 0, 1, 2, \dots, N-1$, where j represents a particular beamforming vector, i denotes an imaginary number, n equals the number of transmit antennas, and N equals the number of beamforming vectors.

Serial No.: 10/533,248
Art Unit: 2618

36.(Canceled).

37.(Previously Presented) A transceiver comprising:

a plurality of n transmit antennas;

circuitry for forming a set of N functions in a unitary space time constellation with one antenna and a coherence time of n ; and

a transmitter for applying said set of N functions as a set of N beamforming vectors to a signal to be transmitted, wherein the set of N functions are of the form

$V_j = 1/\sqrt{n} \exp(i2\pi j/N)$ where $j = 0, 1, 2, \dots, N-1$, where j represents a particular beamforming vector, i denotes an imaginary number, n equals the number of transmit antennas, and N equals the number of beamforming vectors.

38.(Canceled).

39. (Currently Amended) A computer readable medium embodied with a ~~A~~ program of machine-readable instructions, ~~tangibly embodied on an information bearing medium and executable by a digital data processor, to perform actions directed toward determining a parameter usable for beamforming, the actions comprising~~ instructions for:

for a channel matrix that is representative of a channel over which a signal was received, estimating a parameter in the channel matrix by selecting the value of a parameter in a codebook that minimizes a criterion, wherein the codebook is also tangibly embodied on a computer readable medium ~~an information bearing medium~~, wherein when $2^{R/r}/t < 1$, where R is a rate of transmission in bits/sec/Hz, r is a number of receive antennas, and t is a number of transmit antennas, a unit rank beamforming scheme is used, otherwise a higher rank beam forming scheme is used.

40. (Currently Amended) A computer readable medium embodied with a ~~A~~ program of machine-readable instructions, ~~tangibly embodied on an information bearing medium and executable by a digital data processor, to perform actions directed toward determining a parameter usable for beamforming, the actions comprising~~ instructions for:

Serial No.: 10/533,248
Art Unit: 2618

quantizing at least two eigenvectors of a channel;
receiving over a wireless channel an indication of power allocation among the at least two eigenvectors; and
transmitting a signal along the at least two eigenvectors using a power allocation consistent with the received indication, wherein quantizing at least two eigenvectors comprises calculating a dominant one of the two eigenvectors in a codebook that maximizes $\|H(C_i^1)^\dagger\|_2$, said codebook also tangibly embodied on an information bearing medium.

41.(Canceled).

42. (Currently Amended) A computer readable medium as in The program of claim 40, wherein quantizing at least two eigenvectors comprises calculating a non-dominant one of the two eigenvectors by finding that vector in an orthogonal subspace to the dominant eigenvector that maximizes the inner product with a beamformer codebook in the orthogonal subspace to the said codebook.

43. (Currently Amended) A computer readable medium embodied with a A program of machine-readable instructions, tangibly embodied on an information bearing medium and executable by a digital data processor, comprising instructions for calculating A program of machine-readable instructions, tangibly embodied on an information bearing medium and executable by a digital data processor, to calculate a beamforming function in a unitary space time constellation, said beamforming function being of the form

$V_j = 1/\sqrt{n} \exp(i2\pi j/N)$ where $j = 0, 1, 2 \dots N-1$, where j represents a particular beamforming vector, i denotes an imaginary number, n equals the number of transmit antennas, and N equals the number of beamforming vectors.

44.(Canceled).

45.(Canceled).

Serial No.: 10/533,248
Art Unit: 2618

46. (Previously Presented) A system comprising:

a base station; and

a mobile station communicatively coupled to the base station through a channel,
at least one of the base station and the mobile station comprising a transceiver comprising:

a receiver for receiving a first signal from a sender over the channel from at least two
transmit antennas;

a computer readable storage medium for storing a codebook C of parameters;

circuitry coupled to the codebook and to the receiver for estimating a parameter of a
channel matrix of the channel by selecting a value of a parameter in the codebook that minimizes
a criterion; and

a transmitter for transmitting to the sender an indication of the selected value of the
parameter prior to receiving a second signal from the sender, wherein when $2^{R/r}/t < 1$, a unit rank
beamforming scheme is used, otherwise a higher rank beam forming scheme is used, where R is a
rate of transmission in bits/sec/Hz, r is a number of receive antennas, and t is a number of
transmit antennas.
